- What is “omics” and what can we learn from an omics investigation?
- What is the Twins Study?
- What issues is NASA grappling with as it undertakes omic research?

Omics: A neologism for the constellation of an organism's “-omic” information, which includes the genome itself (genomic), transcription products (transcriptomic), protein products (proteomic) and metabolic products (metabolomic).

### SUMMARY

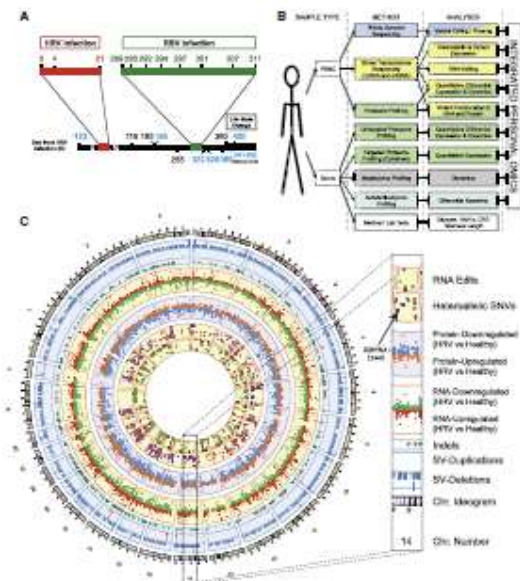

Personalized medicine is expected to benefit from combining genomic information with regular monitoring of physiological states by multiple high-throughput methods. Here, we present an integrative personal omics profile (iPOP), an analysis that combines genomic, transcriptomic, proteomic, metabolomic, and autoantibody profiles from a single individual over a 14-month period. Our iPOP analysis revealed various medical risks, including type 2 diabetes. It also uncovered extensive, dynamic changes in diverse molecular components and biological pathways across healthy and diseased conditions. Extremely high-coverage genomic and transcriptomic data, which provide the basis of our iPOP, revealed extensive heteroallelic changes during healthy and diseased states and an unexpected RNA editing mechanism. This study demonstrates that longitudinal iPOP can be used to interpret healthy and diseased states by connecting genomic information with additional dynamic omics activity.

### INTRODUCTION

Personalized medicine aims to assess medical risks, monitor, diagnose and treat patients according to their specific genetic composition and molecular phenotypes. The advent of genome sequencing and the analysis of physiological states has proven to be powerful (Cancer Genome Atlas Research Network, 2011). However, its implementation for the analysis of otherwise healthy individuals for estimation of disease risk and medical intervention is less clear. Much of the genome is difficult to interpret and many complex diseases, such as diabetes, neurological disorders and cancer, likely involve a large number of different genes and biological pathways (Ashley et al., 2010; Grayson et al., 2011; Li et al., 2011), as well as environmental contributors that can be difficult to assess. As such, the combination of genomic information along with a detailed molecular analysis of samples will be important for predicting, diagnosing and treating diseases as well as for understanding the onset, progression, and prevalence of disease states (Snyder et al., 2008). Presently, healthy and diseased states are typically followed using a limited number of assays that analyze a small number of markers of distinct types. With the advancement of many new technologies, it is now possible to analyze upward of 10<sup>6</sup> molecular constituents. For example, DNA microarrays have allowed the subcategorization of lymphomas and gliomas

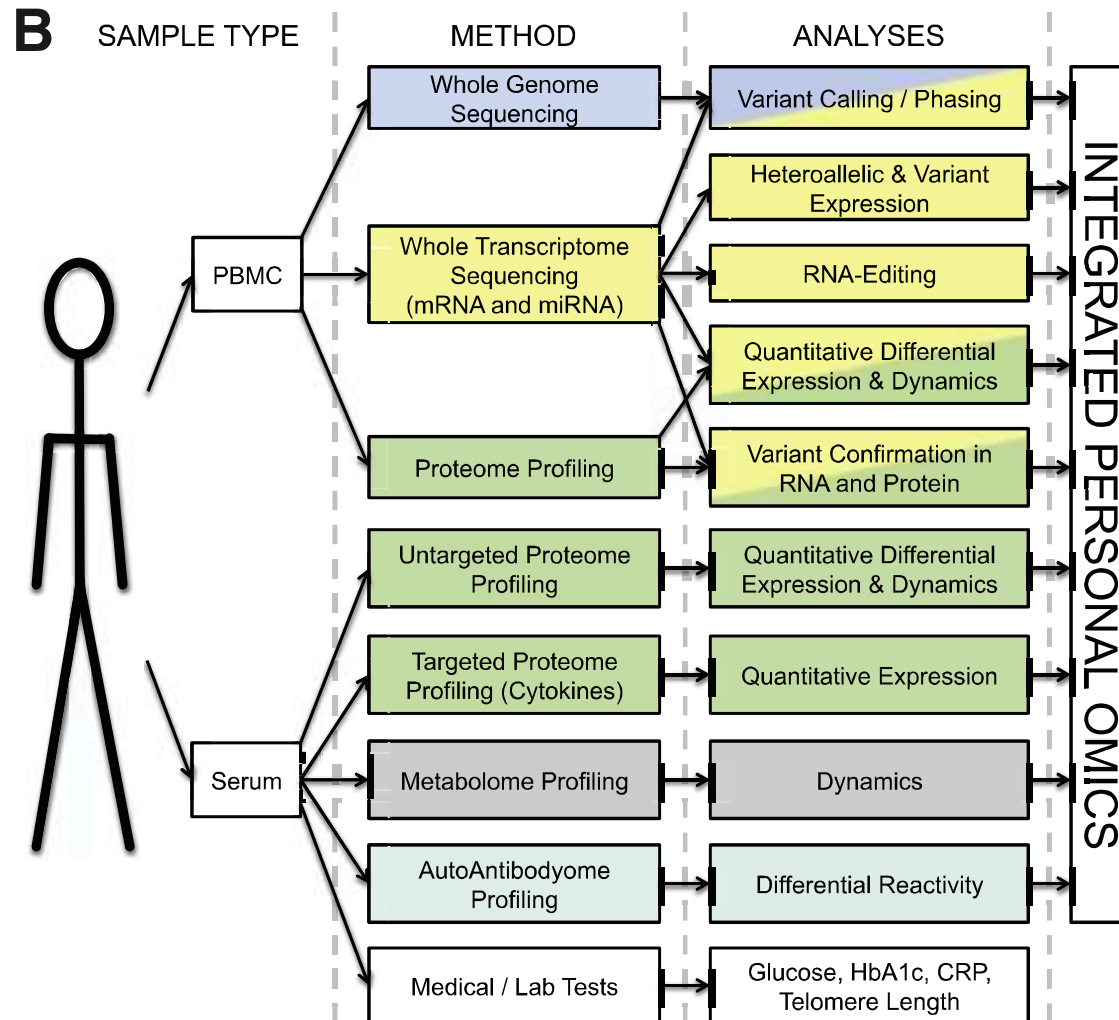

**Figure 1. Summary of Study**  
 (A) Timeline of the study. The subject was monitored for a total of 720 days, during which there were two infections (red bar), HIV (green bar), RDV (black bar) indicates the period when the subject (1) increased exercise, (2) ingested 0.1 mg of acetylsalicylic acid and (3) protein tablets each day (the latter only during the first 6 weeks of this period), and (4) substantially reduced sugar intake. (B) iPOP experimental design indicating the tissues and analyses involved in this study. (C) Circular genome browser view showing the integration of various omics data: chromosome ideogram; genomic data (pink/blue ring); structural variants > 50 bp (blue lines); duplications (red lines); indels (green triangles); transcriptomic data (yellow ring); expression ratio of HIV infection to healthy state; proteomic data (light purple ring); ratio of protein levels during HIV infection to healthy state; transcriptomic data (yellow ring); differential heteroallelic expression ratio of alternative allele to reference allele for missense and synonymous variants (purple dots) and candidate RNA internal and synonymous edits (red triangles, purple dots, orange triangles and green dots, respectively). See also Figure S1.

### WGS-Based Disease Risk Evaluation

We identified variants likely to be associated with increased susceptibility to disease (Dewey et al., 2011). The list of high confidence SNVs and indels was analyzed for rare alleles (<5% of the major allele frequency in Europeans) and for changes in genes with known Mendelian disease phenotypes (data summarized in Table 2), revealing that 51 and 4 of the rare coding SNV and indels, respectively, in genes present in OMIM are predicted

to lead to loss-of-function (Table S2A). This list of genes was further examined for medical relevance (Table S2A; example alleles are summarized in Figure 2A), and 11 were validated by Sanger sequencing. High interest genes include: (1) a mutation (E58K) in the *SERPINA1* gene previously known in the subject, (2) a damaging mutation in *TERF*, associated with acquired aplastic anemia (Yamaguchi et al., 2008), and (3) variants associated with hypertriglyceridemia and diabetes, such as *G6PC*

# Genome: Quantitative Risk Estimates

# Decomposition of the Risk Estimate

C

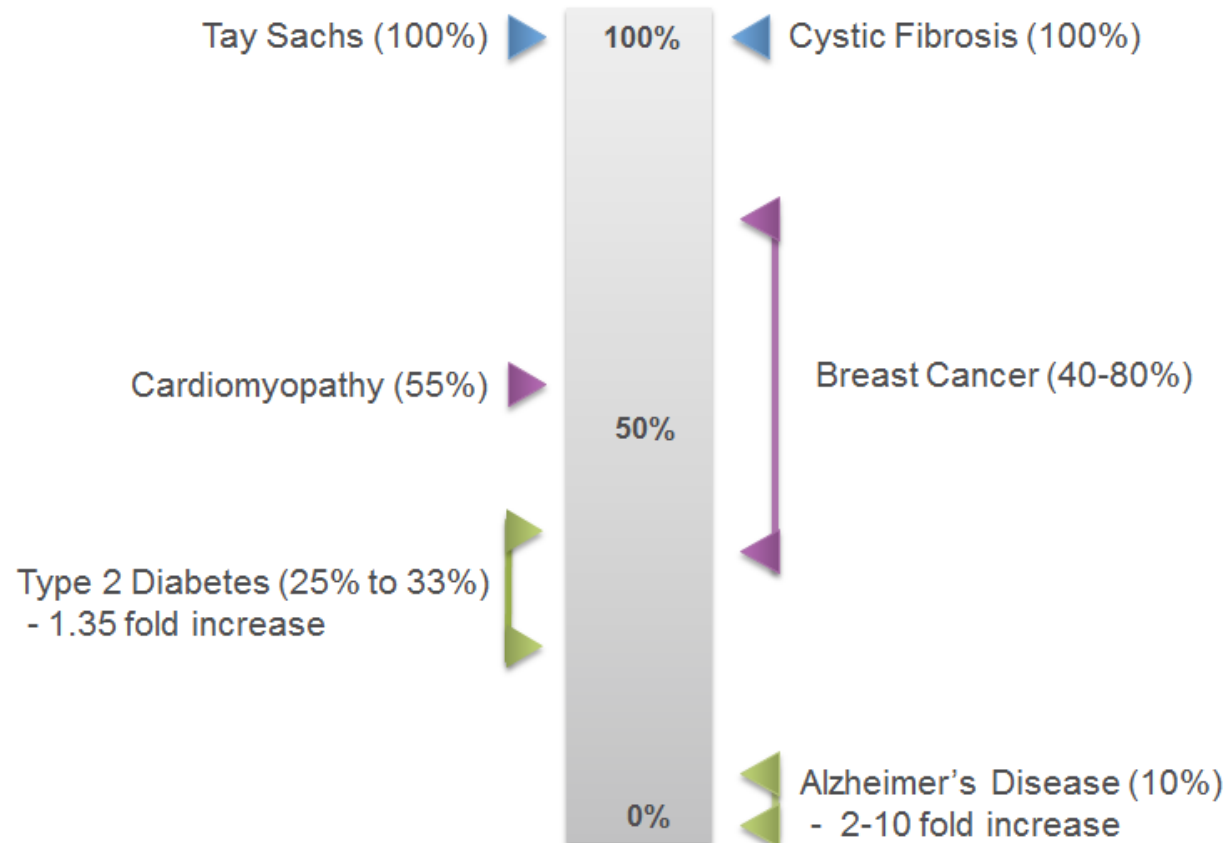

# Wide Range of Predictive Power

## Genomes are complex

- ▲ Monogenic diseases
- ▲ Majority of disease risk by single gene
- ▲ Epigenetic disease(>1 gene + environment)

### 11% of the genes for clinical interpretation

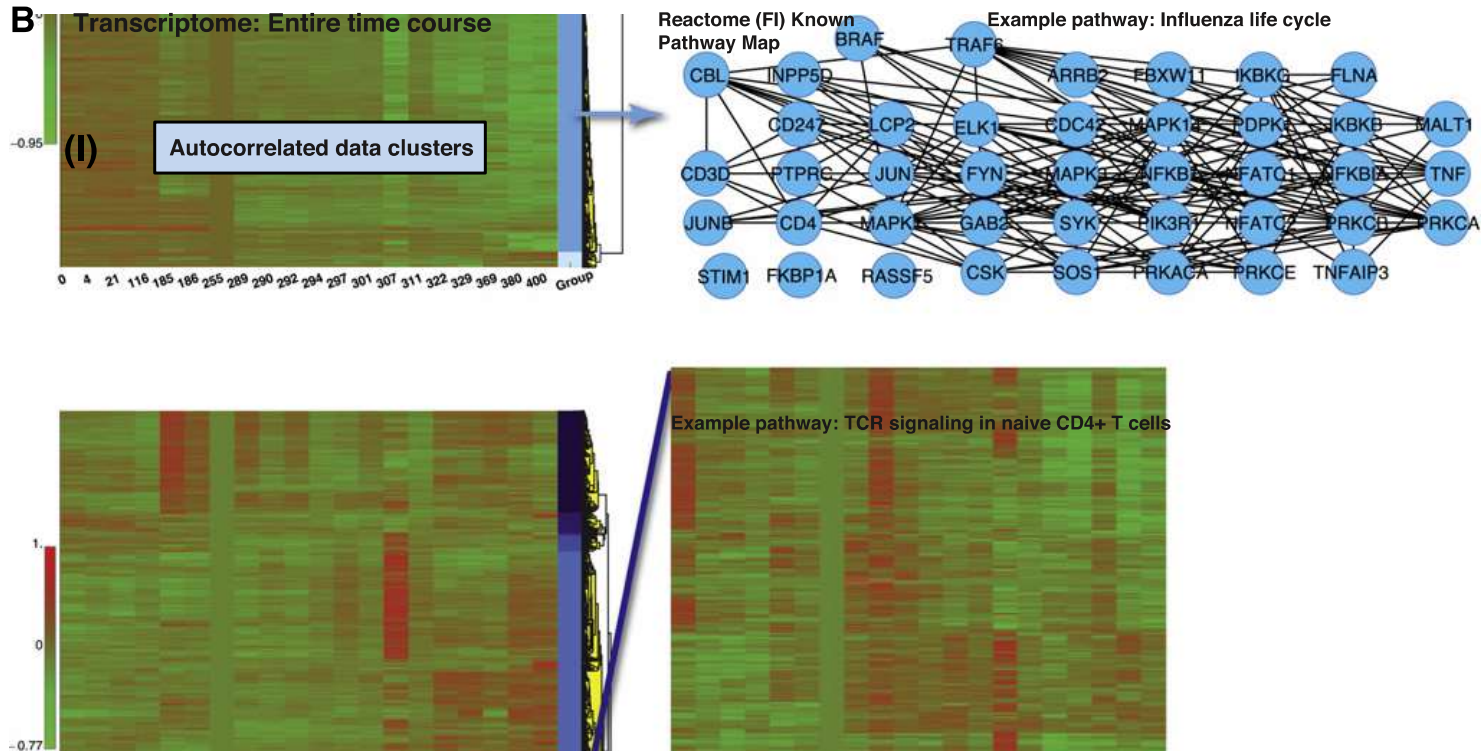

# (Targeted) Metabolome: Glucose

"After a dramatic change in diet, exercise and ingestion of low doses of acetylsalicylic acid a gradual decrease in glucose (to ~93 mg/dl at day 602) and HbA1c levels to 4.7% was observed."

"These results indicate that a genome sequence can be used to estimate disease risk in a healthy individual, and by monitoring traits associated with that disease, disease markers can be detected and the phenotype treated."

# Transcriptome: Unexpected Activations

“A large number of genes with a coexpression pattern common to both infections in the time course have yet to be implicated in known pathways and provide possible connections related to immune response.”

By: Tariq Malik

Published: 11/26/2012 08:12 AM EST on SPACE.com

A veteran NASA space commander and Russian cosmonaut have signed on for the ultimate space voyage: a yearlong trip on the International Space Station.

American astronaut Scott Kelly and Russian cosmonaut Mikhail Kornienko will launch on the [one-year space station flight](#) in spring 2015 and return to Earth in spring 2016, NASA officials announced today (Nov. 26). They will begin their mission training in early 2013.

The mission will help NASA understand how the human body adapts to extremely long space missions, such as voyages around the moon, to an asteroid and ultimately to Mars, NASA officials said.

# NASA will separate twin brothers for a year: one on Earth, one in space

By Carl Franzen on August 5, 2013 09:34 pm Email @carlfranz

DON'T MISS STORIES FOLLOW THE VERGE Like 147k Follow 256K followers

141

Of all the members of NASA's current crop of distinguished astronauts, only two have the unique distinction of being identical twin brothers. And now NASA is using an idea by the brothers, Mark Kelly and Scott Kelly, to perform a study that's been an act-II up until now. Beginning in March 2015, the space agency will be studying the biological states of both twin brothers over the span of a year, with a twist: Scott will be aboard the International Space Station for the duration of that period, while Mark, who retired from NASA back in 2011, will remain back here on Earth.

# Protecting the Human Subject

- Interim policy on genetic research JID 1800.4
  - Applies to the NASA Flight IRB
  - “For purposes of this policy, the term ‘genetic analysis’ includes research involving human DNA, RNA, chromosomes, proteins, or metabolites that detects genotypes, mutations, or chromosomal changes. It excludes the analysis and collection of bio-specimens that will not be submitted to genetic analysis.”
- Changes to the Informed Consent Form

TO: Institution  
FROM: NASA  
SUBJECT: NASA Flight Institutional Review Board (Flight IRB) Review of Proposals Involving Genetic Analysis

1. Purpose and scope

NASA scientists have recently been sought for ideas genetic engineering research. These studies pose the potential for significant advances in our understanding of human interactions with the space environment. The studies also provide the potential for significant benefits to the scientific community and the safety of our future endeavors in space. As a result, NASA has developed a policy to guide research and development of studies involving genetic analysis.

The purpose of this policy, the term “genetic analysis” includes research involving human DNA, RNA, chromosomes, proteins, or metabolites that detects genotypes, mutations, or chromosomal changes. It excludes the analysis and collection of bio-specimens that will not be submitted to genetic analysis.

2. Flight IRB jurisdiction

a. Flight IRB approval of studies involving bio-specimens or genetic analysis

1. All research studies that involve genetic analysis, bio-specimens, or human specimens and be approved by the Flight IRB.
2. The Flight IRB shall oversee all studies involving bio-specimens or genetic analysis or genetic analysis.
3. In addition to meeting all the requirements of the Common Rule and the Center Informational Requirements for (CIR), all studies submitted to the Flight IRB shall comply with the following requirements:
  - a. The protocol shall clearly state whether genetic data will be collected or analyzed as part of the study.
  - b. The protocol shall clearly state whether or not genetic data will be submitted to genetic analysis.

Page 1 of 4

NASA INSTITUTIONAL REVIEW BOARD (IRB)  
CONSENT TO BE A PART OF A RESEARCH STUDY  
ONE YEAR MISSION - NASA TWINS STUDY

NOTE: Any alterations to this consent document will invalidate the bio-subject's consent unless the changes are approved in advance by the IRB.

**ABOUT THIS RESEARCH CONSENT FORM**

You may be eligible to take part in a research study.

A research study is carefully planned and designed to increase scientific knowledge.

This NASA IRB Consent form contains important information about your participation in a research study including the purpose, procedures, and potential risks.

Before you agree to enter the experiment carefully. Take as long as you need to read and ask questions. Make sure you fully understand what will be expected of you and the risks involved with participating in this study. You may also want to discuss the study with your family, friends, or doctor before your participation in this study. If and when you decide to be a participant, you will be asked to sign this form and you will be given a copy.

Taking part in this study is completely voluntary. The decision to participate is yours. You may also leave the study at any time. If you leave the study before you are finished, there will be no penalty to you.

This NASA IRB Consent form provides additional information regarding potential information, including, but not limited to, how, when, where, and by whom a signed informed consent will be obtained.

Please follow the following pre-existing medical conditions may place you at greater risk for injury or other adverse events resulting from your participation in this study.

**I. GENERAL INFORMATION**

1.1 Your study title:

1.2 Your study team includes a Principal Investigator, Co-Investigator, Key Personnel, and a Sponsor/Endorser:

1.3 This study is approved or funded by:

**II. PURPOSE OF RESEARCH (purpose and background)**

2.1 The following is used to justify this genetic research study because:

4/7/2014 NASA IRB - One Year Mission Consent Form

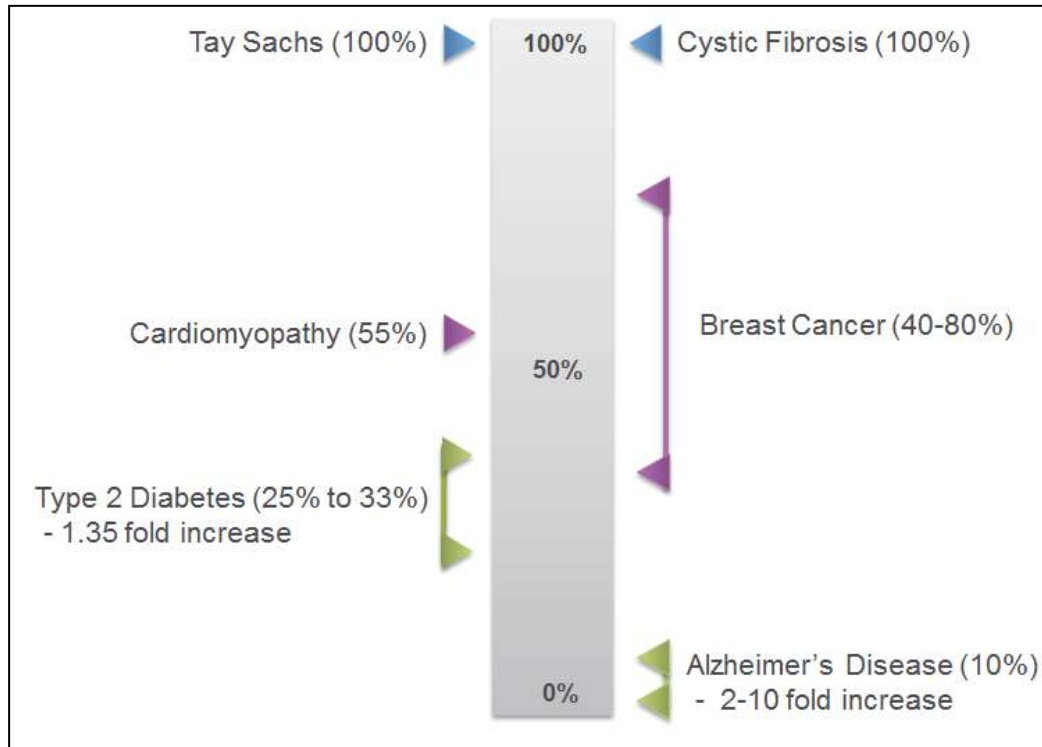

- The primary risks involved in genetic research are risks of social and psychological harm, rather than risks of physical injury
- Genetic studies that generate information about subjects' personal health risks
  - Could provoke anxiety and confusion
  - Damage familial relationships
  - Uncover unwanted information about heritage, ancestry, and family relationships

## II.C. Additional Informed Consent Requirements

1. Any study involving genetic data shall provide test subjects with genetic counseling as appropriate to the study objectives and when requested by the Flight IRB.

- 56 genes might lead to medically actionable results
- American College of Medical Genetics and Genomics (ACMG) 2013 – (<http://goo.gl/C888BY>)

23 Sept 2014

## II.C. Additional Informed Consent Requirements

1. Any study involving genetic data shall provide test subjects with genetic counseling as appropriate to the study objectives and when requested by the Flight IRB.

# Sharing Information with the Research Subject

- Will the subject have the option to receive individual genome sequence data?
- Will the investigators interpret the results of the genome sequence and will that result be disclosed to the research subject?
- If the genome data are given to research subject will he/she have the option to decline to receive all or part of the results?  
(Right Not to Know)
- If there are medically actionable results will the investigators provide expert counseling or referral?

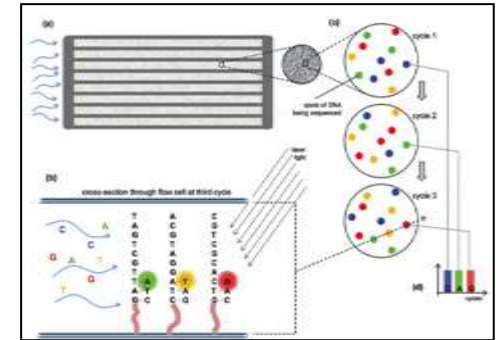

## II.C. Additional Informed Consent Requirements

1. Any study involving genetic data shall provide test subjects with genetic counseling as appropriate to the study objectives and when requested by the Flight IRB.

# Concern: Identifiable Data

- There are several kinds of gene sequencing
  - Whole Genome
  - RNA-seq
  - ChIP-seq
  - Methyl-seq
- All generate identifiable data
  - Deidentified sequences can be re-identified

- Individual genome sequences are unique and therefore uniquely identifiable
- Genome sequence placed in the public domain, may enable others to infer health information about the individual and his/her relatives

## II.B.2. Use of genetic data

- a) Data **shall not be disseminated** beyond the immediate control of the individual investigators documented in the protocol approved by the Flight IRB.
- b) Genetic data **shall not be data-mined or cross-referenced with other databases** of any kind unless approved in advance by the Flight IRB.
- c) Investigators **shall not attempt to identify individual participants** within de-identified data sets or pooled specimens, or to otherwise "reverse engineer" or "disassemble" data sets for bio-specimens involving NASA research subjects.

## II.B.3. Security and Storage of data

- a) Genetic data shall be encrypted and stored on secure servers. All IT systems used to store, process, or analyze genetic data shall comply with NASA's IT security standards for systems containing Privacy Act-protected information. In addition, no genetic data may be stored on mobile devices such as tablets, smart phones, or on removable media.
- b) Genetic data stored on laptops shall be limited to the minimum amount required at any one time for current research purposes.
- c) Once a study is completed, attributable data shall be archived in a secure manner by the investigator. **Investigators may be required to archive original study data at NASA or elsewhere at NASA's direction, and to destroy all copies of the original study data after the study is complete.**

## II.B.4. Release of data

- a) **No genetic sequence data may be posted online or otherwise published or made public.**
- b) The IRB may waive this prohibition for the release of limited sequence data that is non-attributable. **The IRB must approve such a limited release in advance. The informed consent of the affected research subjects will be sought prior to such release.**
- c) The **privacy** of genetic information will be **protected** to the full extent of the law, **including after the death of the subject** to avoid the unwarranted invasion of personal privacy of surviving family members.

# The General Levels of Confidentiality and Privacy

1. The study may retain genome sequences and not allow any data sharing to any third party
2. The study may share with qualified third parties conducting related research
3. The study may share the data using a secure server like the NIH dbGAP
4. The study may deposit the data in a publically accessible database

## II.B.3. Security and Storage of data

c) Once a study is completed, attributable data shall be archived in a secure manner by the investigator. Investigators may be required to archive original study data at NASA or elsewhere at NASA's direction, and to destroy all copies of the original study data after the study is complete.

## II.B.4. Release of data

a) No genetic sequence data may be posted online or otherwise published or made public.  
b) The IRB may waive this prohibition for the release of limited sequence data that is non-attributable. The IRB must approve such a limited release in advance. The informed consent of the affected research subjects will be sought prior to such release.  
c) The privacy of genetic information will be protected to the full extent of the law, including after the death of the subject to avoid the unwarranted invasion of personal privacy of surviving family members.

**II.C.3. Subjects have the right to review presentation slides prior to public presentation and to review manuscript drafts and final publications before public release. Research subjects have the right to have their identifiable information removed from the presentation or publication.**

- What assurances can be made about health insurance, disability insurance, life insurance, and employment?

From the Informed Consent Form (ICF)

12.9 Confidentiality and release of protected health information for genetic research studies

- We will not convey your individual research results from this study to your medical record.
- We will not give your results to anyone else including your doctors. If we find something in your research testing that we believe can be used to directly help you with medical decisions, we will give that information to you.

# Conclusion

- The Twins Study (Scott and Mark Kelly) is NASA's first foray into 21<sup>st</sup>-century omics research
  - Built around Scott Kelly's one year mission
- The Twins Study will examine
  - Genome and epigenome
  - Transcriptome and epitranscriptome
  - Proteome
  - Metabolome
  - Microbiome
  - Physiology
  - Cognition
- NASA is addressing
  - Protections for research subjects
    - Interim Genetic Research Policy JID 1800.4
    - Agency-level policy expected by summer 2016
  - Use of data in medical care and occupational medicine
  - Use of data in mission planning
